The treatment of acute lung injury with anti-cytokine therapy has been shown to significantly improve the outcome in animal models \[[@R25]\]. Furthermore, it has been reported that the inhibition of interleukin 1 (IL-1)

reduces lung inflammation in a CLP model \[[@R26]\]. So far, many studies have focused on the role of macrophages and neutrophils in sepsis-induced lung injury. However, recent studies have reported that the endothelial cells, epithelial cells, and the parenchymal cells of the lung are also involved in the pathology of ALI \[[@R27]--[@R29]\]. Inflammatory cytokines have also been implicated in the endothelial cell activation and damage in ALI \[[@R30]\]. Activated endothelial cells may release pro-inflammatory cytokines such as IL-1, IL-6, TNF, and IL-8. Activated endothelial cells can initiate and amplify the inflammatory response

The mechanisms involved in food allergy prevention are not well understood and still are a subject of controversy. The goal of this review is to highlight the controversies regarding the mechanisms of tolerance induction in food allergy and to review the immunological basis of food allergy

Some patients respond to treatment with a single antipsychotic drug, but for others, antipsychotic monotherapy is associated with low rates of efficacy and significant side effects. In fact, approximately 40-50% of schizophrenic patients show no improvement to antipsychotic medication. Furthermore, studies have shown that adjunctive non-psychiatric medications are more effective than antipsychotic medications alone for treating schizophrenia. There is therefore a pressing need for new treatment options for

schizophrenia and for treatments that reduce or eliminate side effects. A new study published in the Journal of Psychiatric Research (Reference: Gorwood, Walsh, and Price. (2016). A Systematic Review and Meta-analysis of Treatment of Schizophrenia with a Single Antipsychotic Medication and an Adjunctive Antipsychotic Medication or Psychological Intervention) examines the effects of treating schizophrenia with a single antipsychotic drug with or without an adjunctive antipsychotic medication or psychological intervention. The review focused on the first- and second-generation antipsychotics (APs) -- haloperidol,

olanzapine, quetiapine, risperidone and ziprasidone. The authors conducted a systematic review of 13 randomised controlled trials (RCTs)
